DYNAMICS EXPLORER 2

MAG-B HIGH RESOLUTION GMS DATA

81-070B-01G

DYNAMICS EXPLORER 2

MAG-B HIGH RESOLUTION GMS DATA

THIS DATA SET CONSISTS OF 5 MAGNETIC TAPES. THE TAPES ARE 8MM, WRITTEN IN ASCII, CREATED ON THE VAX SYSTEM IN BACKUP FORMAT. THEY ARE LABELED AND CONTAIN SEVERAL SAVESETS PER TAPE, WHICH ARE LISTED BELOW. THE D AND C NUMBER ALONG WITH IT'S TIMESPANS ARE LISTED ALSO.

D#	C#	FILES	TIMESPANS	LABEL
D-108206	C-031953	6	08/15/81-11/19/81	BGMS1
D-108207	C-031954	8	11/20/81-03/19/82	BGMS2
D-108208	C-031955	8	03/20/82-07/08/82	BGMS3
D-108209	C-031956	7	07/09/82-11/19/82	BGMS4
D-108210	C-031957	4	11/20/82-02/16/83	BGMS5

LISTING OF SAVESETS PER TAPE

D-108206	BGMS01.BCK-BGMS06.BCK
D-108207	BGMS07.BCK-BGMS14.BCK
D-108208	BGMS15.BCK-BGMS21.BCK
D-108209	BGMS22.BCK-BGMS28.BCK
D-108210	BGMS29.BCK-BGMS32.BCK

***AN UPDATED README FILE CORRECTS ERRORS IN THE FILE IN EACH BACKUP FILE;

DYNAMICS EXPLORER 2 (DE-2) MAGNETOMETER (MAG-B) HIGH RESOLUTION DATA BASE

This data set contains the MAG-B high resolution data in GMS coordinates with the following OA parameters added to the data set: model magnetic field, magnetic local time, invariant latitude, spacecraft altitude, and geomagnetic longitude and latitude. The three components of the magnetic field in this Cartesian system are B-Radial (positive outward), B-Theta (positive southward) and B-Phi (positive eastward) all oriented relative to the a MAGSAT geomagnetic field model (Langel et al., GRL, 7, 793, 1980).

As with most telemetered geophysical data the vector components of the magnetic field archived here suffer from occasional bad data points. These spurious data entries were caused for the most part by noise introduced in the satellite station telemetry link. Such spurious data can usually be recognized by workers familiar with similar satellite magnetic field data sets. These are usually single point excursions which show no geophysical correlation between the three components of the field.

The dominant source of error in the DE-2 magnetic field measurements is the uncertainty in the attitude of the spacecraft. The DE-2 spacecraft was designed to obtain a final attitude knowledge of ± 0.3 deg which it appears to have attained most of the time. However, episodes of spacecraft nutation with a period near 30 sec and an amplitude of several tenths of a degree were common as well as occasional, several minute errors in the horizon sensor output which produced sudden shifts in attitude of several tenths of a degree. Note that as a general rule an error in spacecraft attitude of 0.1 deg will cause an error in the measured field of about 100 nT per component when the field is transferred from spacecraft to inertial coordinates. For this reason it is common practice to make "baseline corrections" using various physical arguments if higher accuracies are required (e.g., Gary et al., JGR, 99, 11417, 1994). The absolute accuracy of the DE-2 magnetometer can be evaluated after launch only through comparison with precision vector/scalar geomagnetic observatories located on the ground. On the basis of such cross-comparisons a 1-sigma error in the total field magnitude over the course of the DE-2 mission of ± 28 nT has been determined (Langel, Geological Soc. of India Mem., 24, 3, 1992).

The data set consists of daily files from day 81227 to 83047. Each file contains all the available data for a given day. If there was no magnetometer data for a given time, the time record was left out. If there was magnetometer data but no OA data for a particular time record, a fill value of 9999999.0 was used for the OA data.

Each daily file contains a different number of records depending upon how much data was taken for a given day. Each record in the daily files contains the following information:

Year	integer*4
Day	integer*4
Time	integer*4 Time of MAG-B measurement in milliseconds
Mode	integer*4 Instrument mode at time measurement taken. This value does not change for the DE-2 magnetometer.
BR	real*4 Radial-Component of the Measured magnetic field in GMS coordinates
BTH	real*4 Theta-Component of the Measured magnetic field in GMS coordinates
BPH	real*4 Phi-Component of the Measured magnetic field in GMS coordinates
MR	real*4 Radial-Component of the Model magnetic field in GMS coordinates
MTH	real*4 Theta-Component of the Model magnetic field in GMS coordinates

MPH real*4 Phi-Component of the Model magnetic field in GMS coordinates
GALT real*4 Satellite altitude
MLONG real*4 Magnetic longitude
MLAT real*4 Magnetic latitude
MLT real*4 Magnetic local time
ILAT real*4 Invariant latitude

The files are unformatted so therefore the files may be read using the following FORTRAN statement.

```
READ(UNIT) YEAR, DAY, TIME, MODE, BR, BTH, BPH, MR, MTH, MPH, GALT,  
+ MLONG, MLAT, MLT, ILAT
```

Remember to declare time as an integer*4.

Two IDL procedures are included with this data set. The first IDL procedure reads the data and does not average. The second program reads and averages the data. A brief explanation of the IDL procedures follows:

1. Program DEHIRES_load loads the high resolution magnetometer data for a time interval no greater than one hour.

```
dehires_load, filename, start, finish, br, bth, bph, mod_br, mod_bth,$  
mod_bph, galt, mlt, ilat, mlong, mlat, time, flag
```

Inputs: Daily file name, start time, end time

Outputs: Br, Bth, Bph, Mr, Mth, Mph, altitude, magnetic local time, invariant latitude, magnetic longitude, magnetic latitude, time, and a flag if there was no data in the requested interval.

2. Program DELOAD_AVE loads and averages the magnetometer data.

```
deload_ave, filename, start, finish, res, abr, abth, abph, amod_br,$  
amod_bth, amod_bph, mid_alt, mid_mlt, mid_ilat, mid_mlat,$  
mid_mlng, mid_time, flag
```

Inputs: Daily file name, start time, end time, averaging resolution

Outputs: Averaged Br, Bth, Bph, Mr, Mth, Mph, and midpoints of altitude, magnetic local time, invariant latitude, magnetic longitude, magnetic latitude, time, and a flag if there was no data in the interval that was to be averaged.

Up-dated 1-20-95

J. Slavin
